Abstract

BACKGROUND AND OBJECTIVES: Many patients with post-traumatic stress disorder (PTSD) achieve but partial remission with current treatments. Patients with unremitted PTSD show high rates of substance abuse. Marijuana is often used as compassion add-on therapy for treatment-resistant PTSD. This open-label study evaluates the tolerance and safety of orally absorbable $\Delta(9)$ -tetrahydrocannabinol (THC) for chronic PTSD.

METHODS: Ten outpatients with chronic PTSD, on stable medication, received 5 mg of Δ (9)-THC twice a day as add-on treatment.

RESULTS: There were mild adverse effects in three patients, none of which led to treatment discontinuation. The intervention caused a statistically significant improvement in global symptom severity, sleep quality, frequency of nightmares, and PTSD hyperarousal symptoms.

CONCLUSIONS: Orally absorbable $\Delta(9)$ -THC was safe and well tolerated by patients with chronic PTSD.
